ACG should advance to option design, but only through two targeted pilot designs and three evidence gates

ACT NOW

All 23 delayed accounts use portal or spreadsheet reporting; payment friction concentrates in two supplied-record cohorts

Design pilots for delayed balance sources and manual-touch/cross-border-wire flows

DESIGN, DO NOT BOOK

The all-status 14-day payment-intent sensitivity leaves $38.13m net on 30 June, but validated movable cash is not established

Continue liquidity option design; book $0 in the funded case until certification

CONSTRAIN THE CASE

150 hours/month and ten closures are unsupported as funded benefits

Use 50 hours/month and two closures only as downside tests

DECISIONS REQUESTED TODAY

1. **Authorize Week 3 option development and comparison:** local stabilization, federated coordination, and globally coordinated alternatives around one data/control foundation, using the $21m / two-closure / 50-hour downside tests.
2. **Approve design—not execution—of two bounded validation pilots:** delayed balance reporting and manual-touch/cross-border-wire payment cohorts, outside peak season with service, control, and four-hour rollback gates.
3. **Approve the evidence owners and proposed due dates:** visibility (Group Treasurer, 18 August), payment/process (Shared Services Lead, 19 August), and mobility/economics (Group Treasurer, 21 August); keep related value outside the funded case until certification and Finance approval.

GOVERNING MESSAGE ACG has enough evidence to design and test the transformation—not enough to fund the full value claim.

Source: Week 2 findings F07–F11; 57/57 Week 2 diagnostic assertions and 10/10 supplied data-quality tests pass.

Reporting delay is source-concentrated and testable; the analysis does not yet validate a movable-cash amount

Visibility: every delayed account sits in two source methods

API 12 accounts Same day	HOST-TO-HOST 20 accounts Same day
PORTAL 9 accounts One day late	SPREADSHEET 14 accounts Two-to-three days late

58.18% of account-days are same-day under the date proxy. Across the six-month panel, same-day accounts represent **55.15%** of summed positive estimated-available USD across account-days. Median delayed positive estimated availability is **$26.01m/day**. **The reporting-date proxy is not proof of start-of-day or within-24-hour visibility.**

30 June liquidity ladder

Gross positive estimated availability	**$57.80m**
Preliminary restriction flags	–$8.05m
Negative account positions	–$2.14m
Apparent net before buffer	**$47.61m**
Effective reduction after account floors (all statuses)	–$9.48m
All-status 14-day payment-intent sensitivity	**$38.13m**
Validated movable cash — **not established**	N/E

NET THRESHOLD	SEVEN-DAY WINDOWS	14-DAY WINDOWS
$21m stress	175/175	168/168
$35m base	175/175	138/168 **= 82%; 30 failures**
$46.2m upside	0/175	0/168

ASK The all-status 14-day payment-intent window is $12.65m; $10.83m sits on preliminarily unflagged accounts, and account-level floors cap the effective reduction at $9.48m. **Validate timestamps for all 55 accounts and certify mobility, buffers, funding events, facility use, and economics before any liquidity value is funded.**

Source: W2 visibility diagnostic; W2 liquidity scenarios and thresholds.

Within 7,600 supplied records, two cohorts—not the whole payment estate—should anchor root-cause testing

MANUAL-TOUCH RECORDS

METRIC	MANUAL	NO MANUAL	DIFFERENCE
Record share	**31.51%**	68.49%	—
Exception rate	**12.69%**	3.36%	**+9.33 pts / 3.78×**
Late-release rate	**9.48%**	2.94%	**+6.54 pts / 3.22×**
Repair contribution	**63.35%**	36.65%	—

WIRE GEOGRAPHY

METRIC	CROSS-BORDER	DOMESTIC	DIFFERENCE
Records	**786**	612	—
Exception rate	**13.99%**	4.41%	**+9.58 pts / 3.17×**
Late-release rate	**8.78%**	4.90%	**+3.88 pts**
Repair contribution	**24.51%**	5.74%	—

Repair contribution is each cohort's share of all repair minutes in the extract. The two cohorts overlap and must not be added; findings are descriptive within the supplied records, not causal or ACG-wide.

COUNTEREVIDENCE KEEPS THE RECOMMENDATION TARGETED

87.31% of manual-touch records have no exception

86.01% of cross-border wires have no exception

Reason codes, event sequence, criticality, corridor, and approval/release timestamps are absent.

ASK Reconcile the source population, then test intake completeness, cutoff discipline, format, and required controls in these two cohorts before sizing automation value.

Source: W2 payment diagnostic; W2 analysis log (A11).

A controlled data-to-decision spine—not ERP replacement—constrains Wave 1 sequencing

SUPPORTING FINDINGS

FINDING	CURRENT EVIDENCE	DESIGN CONSEQUENCE
Capacity is material but unvalidated	617.72 estimated manual hours/month; the process repair estimate is 84% above the payment-file estimate (unreconciled source estimates); High-criticality work = 315.48 hours	Reconcile scope, preserve/replace controls, and validate observed/removable time before funding 150 hours/month
Ten closures are unsupported	Four candidates; $7,800 estimated annual fees	Treat as controlled housekeeping, not a business-case pillar

TARGETED MATURITY READOUT

EMERGING TODAY		18-MONTH OBSERVABLE TARGET
End-to-end ownership unconfirmed	→	Confirmed global/local RACI
Manual source and process handoffs	→	Owned data, standard intake/cutoff
Unvalidated controls and KPIs	→	Tested SoD, resilience, rollback, KPI
Three ERPs + 23 delayed sources	→	Staged integration around existing ERPs

ASK Confirm the draft RACI and require data, control, service, and rollback gates before platform or pilot scale decisions.

Source: W2 process capacity; repair baseline reconciliation; account diagnostic; maturity heatmap; current-state process map and RACI.

Three validations will determine which Week 3 option survives the downside

EVIDENCE GATES ⟶ COMMON DOWNSIDE TESTS ⟶ THREE-OPTION COMPARISON

EVIDENCE-TO-DECISION GATES

1. **Visibility** 18 Aug · Group Treasurer
   Unlocks pilot scope, architecture, 50/55 feasibility
2. **Payment / process** 19 Aug · Shared Services Lead
   Unlocks targeted intervention and capacity case
3. **Mobility / economics** 21 Aug · Group Treasurer
   Unlocks validated liquidity range and funded value

EVERY OPTION MUST SURVIVE THE SAME TESTS

DOWNSIDE TEST	STRESS	CURRENT DIAGNOSTIC POSITION
Liquidity	$21m	Survives every modeled complete window; still not validated mobility
Closures	2 accounts	Four candidates evidenced; ten unsupported
Capacity	50 hours/month	Screening baseline exists; removability unvalidated
Controls / service	Four consecutive weeks + four-hour rollback	Requirements proposed; owner approval pending

WEEK 3 DIRECTION

Develop and compare **local stabilization, federated coordination, and globally coordinated** options. The preferred option must create one enterprise data/control spine, preserve defined local autonomy, work around existing ERPs, avoid peak-season disruption, and keep unvalidated value outside the funded base.

DECISION REQUESTED Authorize the Week 3 three-option comparison; approve design—not execution—of the two validation pilots; approve the dated evidence owners and due dates, with unvalidated value outside the funded case until certification.
