

Getting Started

1. Create your project repository

Create a **private repository** named `project-northstar`, then extract the full contents of `Baker_Project_Northstar.zip` into the repository root. Keep the existing folder structure unchanged.

If you are starting locally:

```
mkdir project-northstar
cd project-northstar
git init
# Copy and extract the project package here.
git add .
git commit -m "Initialize Project Northstar"
```

Connect the folder to your private remote repository and push the initial commit using the instructions provided by your repository platform.

2. Understand the project package

Location	What it contains
<code>WELCOME_BAKER.md</code>	Your engagement welcome letter and role
<code>README.md</code>	Project overview, requirements, and final deliverables
<code>program/</code>	Engagement charter, one-month playbook, consulting standards, and evaluation rubric
<code>client/</code>	Client brief, stakeholder evidence, and data dictionary
<code>references/</code>	JPMorgan benchmarks, client cases, official links, and citation guidance
<code>data/raw/</code>	Source datasets; do not edit these files manually
<code>data/processed/</code>	Reproducible analytical outputs created by your code
<code>src/</code>	Data generator and starter Python analysis
<code>tests/</code>	Data-quality checks
<code>templates/</code>	Workplan, issue tree, source log, risk register, weekly update, memo, and presentation templates
<code>deliverables/working/</code>	Your weekly working files and submissions
<code>deliverables/final/</code>	Your final executive deliverables

3. Run the project setup

```
python3 -m pip install -r requirements.txt
python3 src/generate_data.py
python3 src/starter_analysis.py
python3 tests/test_data_quality.py
```

All data-quality checks should pass before you begin the diagnostic analysis.

4. Organize your weekly submissions

Create one folder for each week:

```
deliverables/working/week_1/
deliverables/working/week_2/
deliverables/working/week_3/
deliverables/working/week_4/
```

Follow program/ONE_MONTH_PLAYBOOK.md. Submit one integrated assignment and one weekly update at the end of each week. Commit your work regularly with clear messages so that your analysis and decisions remain traceable.
